Introduction to networks

1.Draw a simple diagram (hand-drawn or digital) showing how your phone connects to Instagram, including your device, WiFi router, ISP, and Instagram server. Label each part and the connections.
ANS:

Here is a simple, hand-drawn-style diagram showing how your phone connects to Instagram through Wi-Fi, the ISP, and the Instagram server.
Use this diagram for your assignment. You can copy it into your notebook and label each part.
Connection flow: Phone → Wi-Fi Router → ISP → Internet → Instagram Server.

2.List 5 devices you use or see daily that are part of a network (for example: smartphone, smart TV, WiFi router, laptop, smartwatch). For each, write what type of network it connects to (LAN, WAN, PAN, etc.).
ANS:

No. device	Type of Network
Smartphone	WAN / WLAN
Laptop	LAN / WLAN
Wi-Fi Router	LAN
Smart TV	LAN / WLAN
Smartwatch	PAN

3.Explain the difference between the Internet and an intranet using an example from your college or a public WiFi you have used.

ANS:
Difference Between Internet and Intranet

Internet	**Intranet**
The Internet is a worldwide public network.	An intranet is a private network used within an organization.
Anyone with an Internet connection can access public websites.	Only authorized users can access it.
Example: Google, YouTube, and Instagram.	Example: A college's internal student portal.

Example: When I use my college's public Wi-Fi to access YouTube, I am using the Internet. If I log in to my college's private student portal to check attendance or exam results, I am using an intranet if the portal operates on the college's private internal network.

**4.Pick any one app you use (like WhatsApp, Zomato, or Flipkart) and describe, in 4-5 lines, how data travels from your device to their server and back when you perform a search inside the app.

Hint: Mention the devices and networks involved, and what happens when you hit 'search'.**

ANS:

Example: WhatsApp

1. I open WhatsApp on my smartphone and type a search in the app.
2. My phone sends the search request through Wi-Fi or mobile data to the Internet.
3. The request travels through my router or mobile network and ISP to WhatsApp's server.
4. The WhatsApp server processes the request and sends the matching results back through the Internet.
5. My phone receives the data and displays the search results on the screen.
